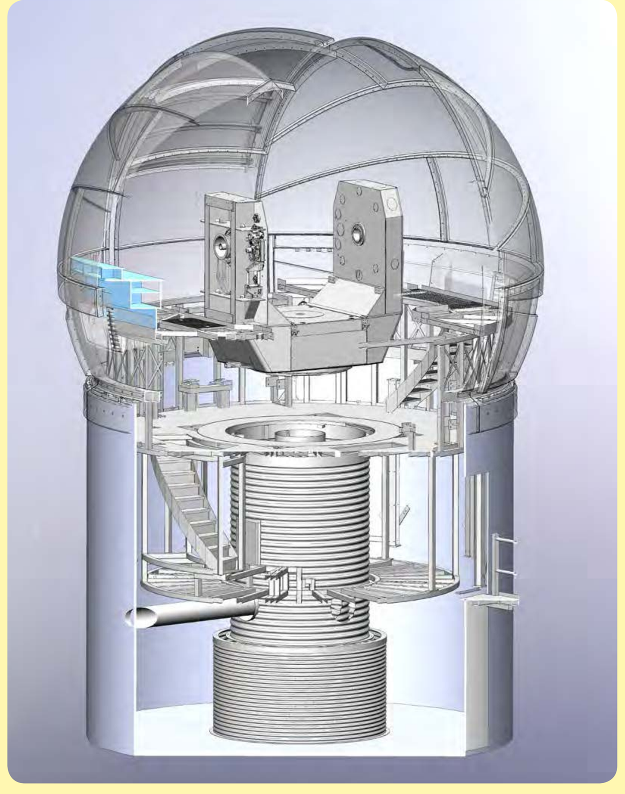
ENGN4221 Systems Engineering Project, ANU TechLauncher 2017

Australian National University

Project Summary

The Adaptive Optics group at the Australian National University (ANU) Research School of Astronomy and Astrophysics (RSAA) have teamed up with EOS Space Systems to equip the EOS laser space debris tracking station located at the ANU Mount Stromlo Observatory with an Adaptive Optics Demonstrator (AOD).



The AOD project is a joint project whereby ANU provides LGS AO expertise and EOS provides space debris tracking and laser expertise.

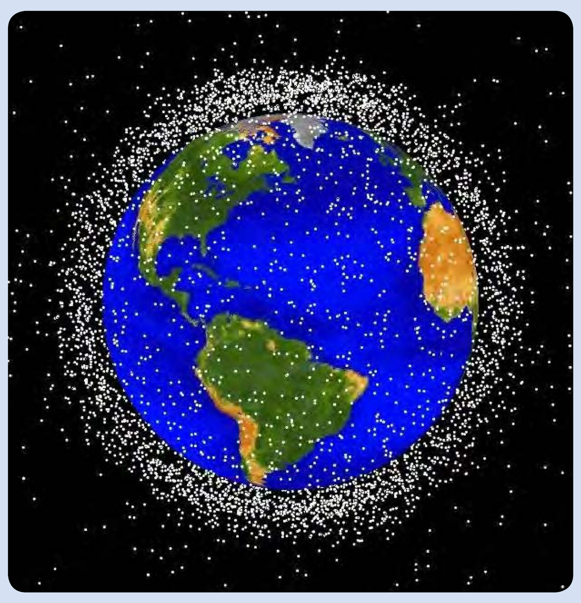
While the AO bench itself is developed mostly by the ANU, the LGS facility is a more collaborative effort that [more text to go here and here and he]

Project Goals

- Perform requirements analysis for interface between EOS 1.8m telescope and three GSLs
- Develop a conceptual mounting solution

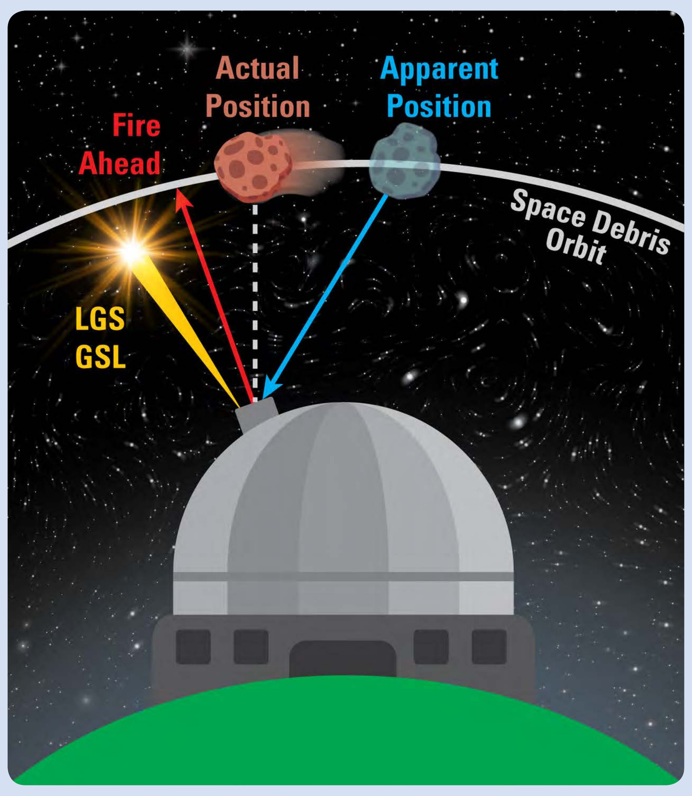
Background

Space Debris - why is it a problem?
SERC Research Program - some general dates and timeframes
http://www.serc.org.au/research/



Tracking Space Debris

The fundamental principle of Einstein's Theory of Relativity is that light travels at a very fast but finite speed. Consequently, when we observe something we actually see an apparent position - an image from the past. When tracking moving objects such as space debris, a tracking laser must be fired ahead of the actual target position to account for target movement and finite light travel time. As this light passes through the Earth's turbulent atmosphere, it becomes distorted and causes blurry images to be captured on telescope tracking instrumentation.



A Laser Guide Star (LGS), created by propagating a Guide Star Laser (GSL) at 589nm into the atmosphere, acts as a stable artificial star reference for adaptive optics (AO) corrections, which are performed by cleverly deforming internal telescope mirrors in real-time. As a result, this allows the AO-equipped ANU/EOS Space Systems laser space debris tracking station, based on Mount Stromlo in Canberra, Australia, to track smaller and more distant debris.

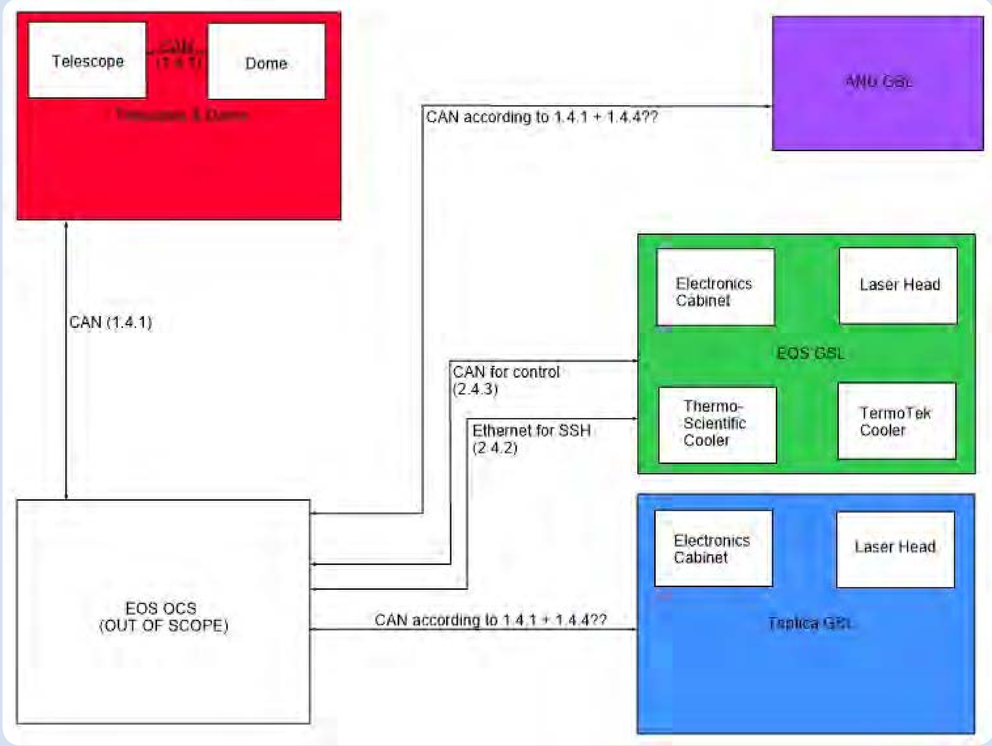
Top-Level System Architecture

The interfaces and constraints of the system that fall within the definition of the Scope Statement are outlined from a top level perspective.

There are four major groupings of interfaces within the top level System Interface

1. 1.8m telescope
2. EOS GSL
3. Toptica GSL
4. ANU GSL

Each of these interfaces are further broken down to Physical, Electrical, Optical, Logical and Environmental.



System Specifications

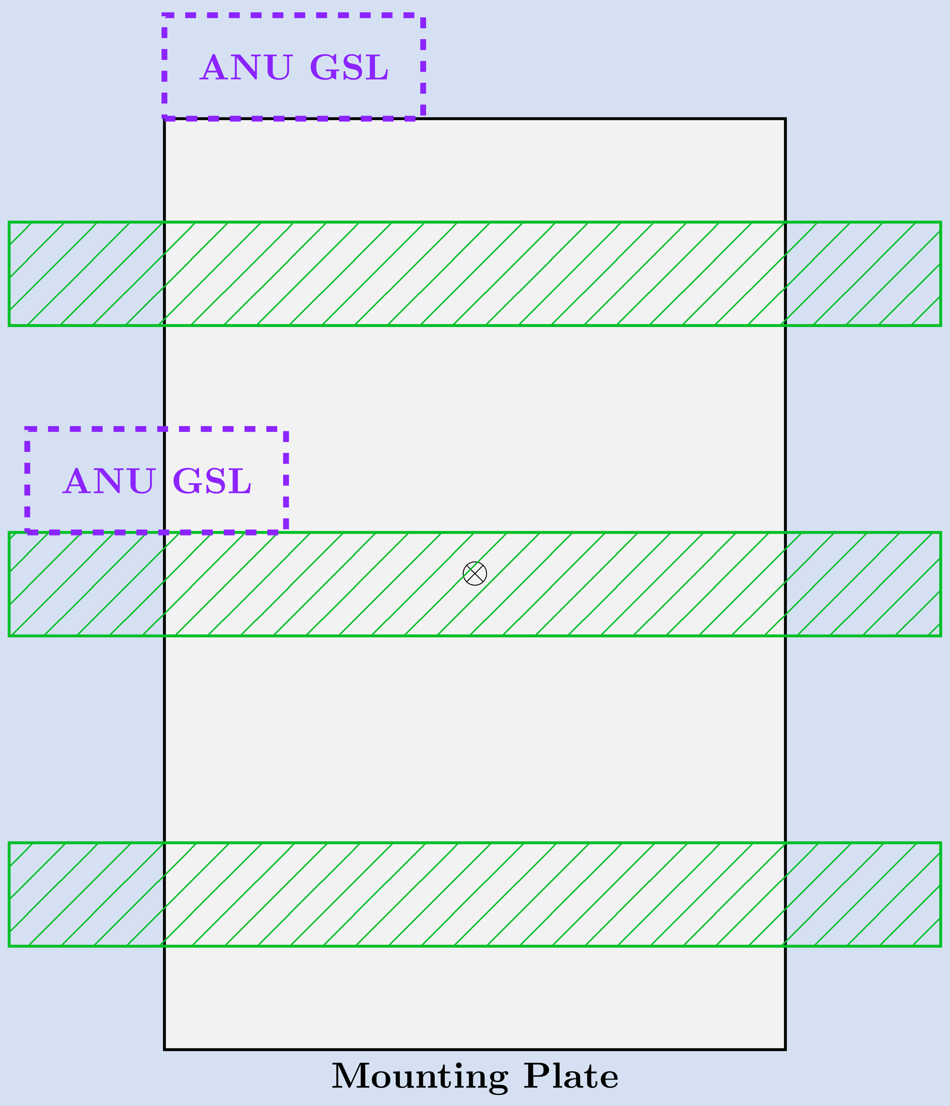
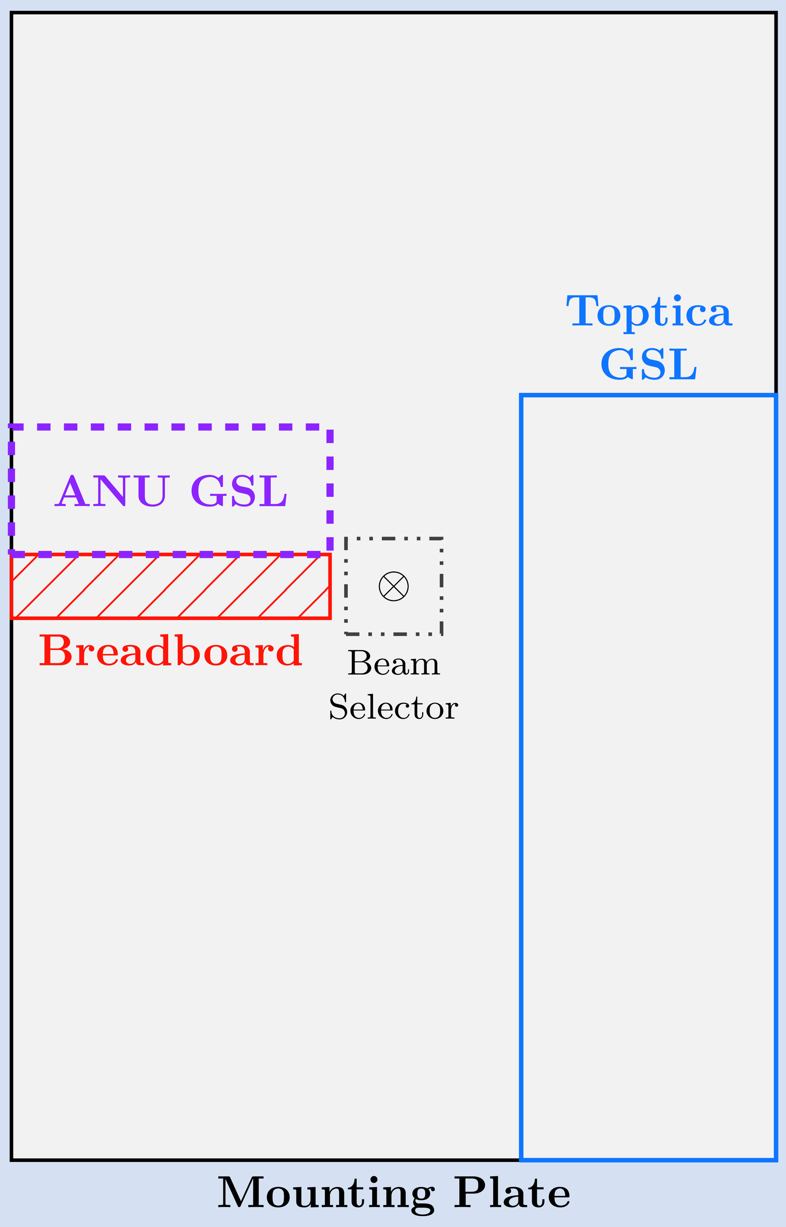
Conceptual Design 1

Meatball sausage ball tip, pancetta ham bacon tri-tip meatloaf kevin flank spare ribs corned beef. Porchetta capicola jowl shank, shankle sausage chuck chicken bacon ground round pastrami beef. Pig bresaola meatloaf fatback, beef frankfurter pork belly drumstick spare ribs shoulder beef ribs jerky boudin corned beef sausage. Turducken filet mignon ball tip shankle bacon rump cow corned.



Conceptual Design 2

Jowl prosciutto meatball capicola cupim brisket fatback leberkas bacon pork chop pancetta picanha beef. Short loin turducken shankle ball tip bacon sirloin pork belly t-bone meatball tenderloin kielbasa corned beef. Drumstick fatback meatloaf tenderloin, beef frankfurter pork belly drumstick spare ribs shoulder, shankle sausage chuck chicken beef, swine brisket shoulder short ribs pork duck.



Conclusion and Handover

About the Project Team

We are too cool for school. Nobody can keep up with us. You can run but you can't hide. We will strike at midnight.

Acknowledgements

Special thanks go to our project supervisor Celine d'Orgeville for blah blah blah. Further thanks for the invaluable technical expertise of AITC and EOS staff members. In particular: Brady Espeland, Mark Blundell, James Webb and James/Jack.
